# **AMENDMENTS TO THE CLAIMS**

1. (Currently Amended) A compound represented by [[the]] <u>a</u> formula <u>selected from the</u> group consisting of: M-Y,

$$NO_2$$
  $R_1$   $NO_2$   $M$   $NO_2$  ,

$$NO_2$$
  $NO_2$   $NO_2$ 

$$NO_2$$
 $R$ 
 $NO_2$ 
 $R$ 
 $A \rightarrow B$ 
, and

wherein the aromatic ring is optionally substituted with an alkoxy group or a

# methylenedioxy group; and

## wherein:

M is a monomeric building block, a solid surface or a gel having a reactive site that is masked by Y; and

Y is a photolabile protecting group selected from the group consisting of:

## wherein:

the aromatic ring is optionally substituted with an alkoxy group or a methylenedioxy group;

A is O, S, N-alkyl, N-aryl or  $(CH_2)_n$ ; n is 1 to about 3;

B is an aprotic, weakly basic group;

R and R<sub>1</sub> are each, independently, -H, an optionally substituted alkyl group, an optionally substituted alkenyl group, an optionally substituted alkynyl group, and optionally substituted aryl group, or an optionally substituted heteroaromatic group, and wherein the bond between M and C=O is capable of being cleaved by photolysis using light having a wavelength of about 365 nm.

- 2. (Previously Presented) The compound of Claim 1, wherein M is selected from the group consisting of an amino acid, a peptide, nucleoside, polynucleotide or analogs thereof, a monosaccharide and a protein.
- 3. (Previously Presented) The compound of Claim 2, wherein M is a base-protected deoxynucleoside, wherein the deoxynucleoside is a deoxyadenosine, a deoxycytidine, a thymidine or a deoxyguanosine.
- 4. (Previously Presented) The compound of Claim 3, wherein M is selected from the group consisting of base protected deoxynucleoside H-phosphonates and base protected deoxynucleoside phosphoramidites.
- 5. (Currently Amended) A method of attaching a molecule with a reactive site to a support comprising the steps of:
  - (a) providing a support with a reactive site;
  - (b) binding a first molecule represented by [[the]] a formula selected from the group consisting of  $M_{+}$ - $Y_{+}$  to the reactive site, wherein:

Application No.: 09/659599

 $NO_2$ 

Docket No.: AFMX-P01-036

wherein the aromatic ring is optionally substituted with an alkoxy group or a

, and

ŅΟ<sub>2</sub>

# methylenedioxy group, to the reactive site,

# wherein:

 $\underline{M}$  [[M<sub>1</sub>]] is a monomeric building block having a reactive site <u>attached to</u> the carbonyl moiety indicated in the formula that is masked by  $Y_t$ ; and

Y<sub>t</sub> is a photolabile protecting group selected from the group consisting of:

#### wherein:

the aromatic ring is optionally substituted with an alkoxy group or a methylenedioxy group;

A is O, S, N-alkyl, N-aryl or  $(CH_2)_n$ ;

n is 1 to about 3;

B is an aprotic, weakly basic group;

R and R<sub>1</sub> are each, independently, -H, an optionally substituted alkyl group, an optionally substituted alkenyl group, an optionally substituted alkynyl group, an optionally substituted aryl group, or an optionally substituted heteroaromatic group.

and wherein the bond between M and C=O is capable of being cleaved by photolysis using light having a wavelength of about 365 nm; and

- (c) <u>cleaving the bond between M and C=O</u> removing  $Y_t$  to provide a derivatized support comprising a monomeric building block [[M<sub>1</sub>]] with an unmasked reactive site immobilized thereon.
- 6. (Original) The method of Claim 5, wherein the binding step in (b) is covalent.
- 7. (Currently Amended) The method of Claim 5, further comprising:
  - (a) coupling an additional molecule represented by the <u>a</u> formula <u>of step (b) of Claim</u>

    <u>5</u> M<sub>1</sub>-Y<sub>1</sub> to the unmasked reactive site, wherein Y<sub>1</sub> of the additional molecule is

    selected from the group of photolabile protecting groups listed in Claim 5 and is

    the same as or different from Y<sub>1</sub> of the first molecule, and M<sub>1</sub> of the additional

    molecule is a monomeric building block and is the same as or different from M<sub>1</sub>

    of the first molecule, to produce a derivatized support having immobilized thereon
    a chain of the first and the additional molecules; and
  - (b) <u>cleaving the bond between M and C=O</u> removing Y<sub>t</sub> from the additional molecule to provide a derivatized support with a chain of the first and the additional

molecules with an unmasked reactive site immobilized thereon.

(Previously Presented) The method of Claim 7, further comprising repeating steps (a) and(b) to provide a chain of molecules immobilized on the support.

- 9. (Currently Amended) The method of Claim 8, wherein M [[M<sub>1</sub>]] for each occurrence is a deoxynucleoside.
- 10. (Original) The method of Claim 5, wherein the support is a glass or silica substrate.
- 11. (Currently Amended) The method of Claim 9, wherein the bond between M and C=O is a

  C-O bond and the O in the C-O bond is located at the 5' position of the deoxynucleoside

  Y<sub>t</sub> of each deoxynucleoside masks a 5'-OH.
- 12. (Currently Amended) The method of Claim 7, wherein the bond between M and C=O in Y<sub>1</sub>-from said second molecules is cleaved removed by irradiation at a wavelength of greater than 350 nm.
- 13. (Original) The method of Claim 12, wherein the wavelength is about 365 nm.
- 14. (Currently Amended) A method of forming, from component molecules represented by the formula M<sub>1</sub>-Y<sub>1</sub>, a plurality of compounds bound to a support, each compound occupying a separate predefined region of the support, said method comprising the steps of:
  - (a) activating a first region of the support;
  - (b) binding a <u>component</u> molecule represented by the <u>a</u> formula <u>selected from the group consisting of:</u>

Application No.: 09/659599

Docket No.: AFMX-P01-036

wherein the aromatic ring is optionally substituted with an alkoxy group or a

, and

methylenedioxy group, M<sub>t</sub>-Y<sub>t</sub> to the first region;

repeating steps (a) and (b) on other regions of the support whereby each of said other regions has bound thereto a molecule represented by the a formula of step
 (b) M<sub>1</sub>-Y<sub>1</sub>, wherein [[M<sub>1</sub>]] M is the same as or different from M [[M<sub>1</sub>]] of step (b) and Y<sub>1</sub> is the same as or different from Y<sub>1</sub> of step (b);

- (d) <u>cleaving the bond between M and C=O, wherein M removing Y<sub>t</sub> from the M<sub>t</sub> that is bound to one or more regions of the support, to provide one or more regions having an unmasked reactive site;</u>
- (e) binding an additional molecule represented by the <u>a</u> formula <u>of step (b)</u> M<sub>t</sub>-Y<sub>t</sub> to the said one or more unmasked reactive sites, wherein [[M<sub>1</sub>]] <u>M</u> is the same as or different from <u>M</u> [[M<sub>1</sub>]] of steps (b) and (c) and Y<sub>t</sub> is the same as or different from Y<sub>t</sub> of steps (b) and (e); and
- (f) repeating steps (d) and (e) on regions of the support until a desired plurality of compounds is formed from the component molecules represented by one or more formulas of step (b) formula M<sub>t</sub>-Y<sub>t</sub>, each compound occupying separate predefined regions of the support;

#### wherein:

[[M<sub>1</sub>]]  $\underline{M}$  is a monomeric building block having a reactive site <u>attached to the</u> carbonyl moiety indicated in the formula that is masked by  $Y_{t}$ ; and  $Y_{t}$  is a photolabile protecting group selected from the group consisting of:

## wherein:

the aromatic ring is optionally substituted with an alkoxy group or a methylenedioxy group;

A is O, S, N-alkyl, N-aryl or  $(CH_2)_n$ ;

n is 1 to about 3;

B is an aprotic, weakly basic group; and

R and R<sub>1</sub> are each, independently, -H, an optionally substituted alkyl group, an optionally substituted alkenyl group, an optionally substituted alknyl

group, an optionally substituted aryl group, or an optionally substituted heteroaromatic group.

and wherein the bond between M and C=O is capable of being cleaved by photolysis using light having a wavelength of about 365 nm.

- 15. (Original) The method of Claim 14, wherein the binding steps are covalent.
- 16. (Currently Amended) The method of Claim 14, wherein  $[[M_1]]$   $\underline{M}$  for each occurrence is a deoxynucleoside.
- 17. (Original) The method of Claim 14, wherein the support is a glass or silica substrate.
- 18. (Currently Amended) The method of Claim 16, wherein the bond between M and C=O is a C-O bond and the O in the C-O bond is located at the 5' or 3' position of the deoxynucleoside Y<sub>t</sub>-of each deoxynucleoside masks a 5'-OH or a 3'-OH.
- 19. (Currently Amended) The method of Claim 14, wherein the bond between M and C=O in Y<sub>+</sub> is cleaved removed by irradiation at a wavelength of greater than 350 nm.
- 20. (Original) The method of Claim 19, wherein the wavelength is about 365 nm.
- 21. (Previously Presented) The method of Claim 14, wherein the plurality of different compounds bound to the support comprises at least 10<sup>6</sup> different compounds.
- 22. (Original) The method of Claim 14, wherein each of the regions has an area of between  $1 \mu m^2$  and  $10,000 \mu m^2$ .
- 23. (Previously Presented) The method of Claim 14, further comprising:

(a) covalently binding a molecule comprising a masked reactive site linked to a
chemically labile protecting group to a reactive site, wherein the reactive site is
either on an activated region of the support as formed in step (a) of Claim 14 or is
an unmasked reactive site on a molecule bound to the support as formed in step
(d) of Claim 14;

- (b) replacing the chemically labile protecting group with a photolabile protecting group to provide a region of the support having a molecule with the photolabile protecting group; and
- (c) optionally repeating steps (d)-(f) of Claim 14.

# 24-29. (Canceled)

30. (Currently Amended) A compound represented by the <u>a</u> formula <del>M-Y<sub>1</sub>, selected from the group consisting of:</del>

$$H_3CO$$
 $NO_2$ 
 $NO_2$ 
 $NO_2$ 

## wherein:

M is a monomeric building block <u>having a reactive site attached to the carbonyl</u> moiety indicated in the formula, a solid surface <u>having a reactive site attached to the carbonyl moiety indicated in the formula</u> or a gel <u>having a reactive site attached to the carbonyl moiety indicated in the formula</u>,

and wherein the bond between M and C=O is capable of being cleaved by photolysis

using light having a wavelength of about 365 nm. having a reactive site that is masked by

Y<sub>t</sub>; and

Y<sub>t</sub> is selected from the group consisting of:

- 31. (Previously Presented) The compound of Claim 30, wherein M is a nucleoside  $\beta$ -cyanoethyl phosphoramidite.
- 32. (Currently Amended) A method of attaching a molecule with a reactive site to a support comprising the steps of:
  - (a) providing a support with a reactive site;
  - (b) binding a first molecule represented by <u>a</u> the formula  $M_t$ - $Y_t$  selected from the group consisting of:

$$H_3CO$$
 $NO_2$ 
 $NO_2$ 
 $NO_2$ 

to the reactive site, wherein:

 $\underline{M}$  [[M<sub>1</sub>]] is a monomeric building block having a reactive site <u>attached to</u> the carbonyl group indicated in the formula, and wherein the bond between M and C=O is capable of being cleaved by photolysis using light having a wavelength of about 365 nm; that is masked by  $Y_t$ ; and

Y<sub>t</sub> is a photolabile protecting group selected from the group consisting of:

$$\begin{array}{c|c} & & & & \\ & &$$

- (c) <u>cleaving the bond between M and C=O</u> removing  $Y_t$  to provide a derivatized support comprising  $[[M_1]]$  <u>M</u> with an unmasked reactive site immobilized thereon;
- (d) coupling an additional molecule represented by <u>a</u> the formula <u>of step (b)</u> M<sub>t</sub>-Y<sub>t</sub> to the unmasked reactive site, wherein Y<sub>t</sub> and M<sub>t</sub> of the additional molecule <u>is</u> are selected independent of the first molecule, to produce a derivatized support having immobilized thereon a chain of the first and the additional molecules;
- (e) <u>cleaving the bond between M and C=O in removing Y<sub>1</sub> from</u> the additional molecule to provide a derivatized support with a chain of the first and the

additional molecules with a second unmasked reactive site immobilized thereon; and

- (f) repeating steps (d) and (e) with a succession of molecules, to provide a chain of molecules immobilized on the support.
- 33. (Currently Amended) The method of Claim 32, wherein  $[[M_1]]$   $\underline{M}$  for each occurrence is a nucleoside  $\beta$ -cyanoethyl phosphoramidite.
- 34. (Currently Amended) A method of forming, from component molecules represented by the formula M<sub>T</sub>-Y<sub>T</sub>, a plurality of compounds bound to a support, each compound occupying a separate predefined region of the support, said method comprising the steps of:
  - (a) activating a first region of the support;
  - (b) binding a molecule represented by the <u>a</u> formula M<sub>t</sub>-Y<sub>t</sub> from the group consisting of:

$$H_3CO$$
 $NO_2$ 
 $NO_2$ 
 $NO_2$ 

$$\begin{array}{c} & & & \\ & &$$

to the first region;

- repeating steps (a) and (b) on other regions of the support whereby each of said other regions has bound thereto a molecule represented by <u>a</u> the formula <u>of step</u>

  (b) M<sub>t</sub>-Y<sub>t</sub>, wherein [[M<sub>1</sub>]] <u>M</u> is the same as or different from [[M<sub>1</sub>]] <u>M</u> of step (b) and Y<sub>t</sub> is the same as or different from Y<sub>t</sub> of step (b);
- (d) <u>cleaving the bond between M and C=O in the monomeric building block</u>

  removing Y<sub>t</sub> from the M<sub>t</sub> that is bound to one or more regions of the support to provide one or more regions having an unmasked reactive site;
- (e) binding an additional molecule represented by the <u>a</u> formula <u>of step (b)</u> [[M<sub>1</sub>-Y<sub>1</sub>]] to the said one or more unmasked reactive sites, wherein <u>M</u> [[M<sub>1</sub>]] is the same as or different from <u>M</u> [[M<sub>1</sub>]] of steps (b) and (c) <del>and Y<sub>1</sub> is the same as or different from Y<sub>1</sub> of steps (b) and (c)</del>; and

(f) repeating steps (d) and (e) on regions of the support until a desired plurality of compounds is formed from the component molecules represented by <u>a</u> formula <u>of step (b)</u> M<sub>1</sub>-Y<sub>1</sub>, each compound occupying separate predefined regions of the support;

## wherein:

 $\underline{M}$  [[M<sub>1</sub>]] is a monomeric building block having a reactive site <u>attached to the</u> carbonyl moiety indicated in the formula, and wherein the bond between M and C=O is capable of being cleaved by photolysis using light having a wavelength of <u>about 365 nm</u> that is masked by  $Y_1$ ; and

Y<sub>t</sub> is a photolabile protecting group selected from the group consisting of:

$$\begin{array}{c|c} & & & & \\ & &$$

- 35. (Currently Amended) The method of Claim 34, wherein  $\underline{M}$  [[ $M_1$ ]] for each occurrence is a nucleoside  $\beta$ -cyanoethyl phosphoramidite.
- 36. (Currently Amended) A compound represented by <u>a</u> the formula <del>M-Y,</del> <u>selected from the group consisting of:</u>

$$NO_2$$
  $R_1$   $NO_2$   $M$   $NO_2$  ,

$$NO_2$$
  $NO_2$   $NO_2$   $NO_2$   $NO_2$   $NO_2$   $NO_2$ 

$$NO_2$$
 $NO_2$ 
 $NO_2$ 

wherein the aromatic ring is optionally substituted with an alkoxy group or a methylenedioxy group,

## wherein:

M is selected from the group consisting of nucleic acids, nucleosides and analogs thereof, nucleotides and analogs thereof, and monosaccharides, all having a reactive site that is masked by Y; and

Y is a photolabile protecting group selected from the group consisting of:

$$NO_2$$
 $R$ 
 $A \longrightarrow B$ , and

### wherein:

the aromatic ring is optionally substituted with an alkoxy group or a methylenedioxy group;

A is O, S, N-alkyl, N-aryl or (CH<sub>2</sub>)<sub>n</sub>;

n is 1 to about 3;

B is an aprotic, weakly basic group; and

R and R<sub>1</sub> are each, independently, -H, an optionally substituted alkyl group, an optionally substituted alkenyl group, an optionally substituted alkynyl group, an optionally substituted aryl group, or an optionally substituted heteroaromatic group, and wherein the bond between M and C=O is capable of being cleaved by photolysis using light having a wavelength of about 365 nm.

- 37. (Currently Amended) A method of attaching a molecule with a reactive site to a support comprising the steps of:
  - (a) providing a support with a reactive site;
  - (b) binding a first molecule represented by <u>a</u> the formula  $M_{\uparrow}$ - $Y_{\uparrow}$  selected from the group consisting of:

Application No.: 09/659599

Docket No.: AFMX-P01-036

wherein the aromatic ring is optionally substituted with an alkoxy group or a methylenedioxy group, to the reactive site, wherein:

, and

 $\underline{M}$  [[M<sub>1</sub>]] is a monomeric building block selected from the group consisting of nucleic acids, nucleosides and analogs thereof, nucleotides and analogs thereof, and monosaccharides, all having a reactive site <u>attached to the carbonyl moiety indicated in the formula</u> that is masked by  $Y_t$ ; and

Y<sub>1</sub>-is a photolabile protecting group selected from the group consisting of:

wherein:

the aromatic ring is optionally substituted with an alkoxy group or a methylenedioxy group;

A is O, S, N-alkyl, N-aryl or  $(CH_2)_n$ ;

n is 1 to about 3;

B is an aprotic, weakly basic group; and

R and R<sub>1</sub> are each, independently, -H, an optionally substituted alkyl group, an optionally substituted alkenyl group, an optionally substituted alkynyl group, an optionally substituted aryl group, or an optionally substituted heteroaromatic group, and wherein the bond between M and C=O is capable of being cleaved by photolysis using light having a wavelength of about 365 nm; and

- (c) <u>cleaving the bond between M and C=O removing  $Y_t$  to provide a derivatized support comprising a monomeric building block [[M<sub>1</sub>]] with an unmasked reactive site immobilized thereon.</u>
- 38. (Currently Amended) A method of forming, from component molecules represented by the formula M<sub>1</sub>-Y<sub>1</sub>, a plurality of compounds bound to a support, each compound occupying a separate predefined region of the support, said method comprising the steps of:
  - (a) activating a first region of the support;
  - (b) binding a molecule represented by the  $\underline{a}$  formula  $\underline{M}_{t}$ - $\underline{Y}_{t}$  selected from the group consisting of:

$$NO_2$$

$$NO_2$$
 $NO_2$ 
 $NO_2$ 

wherein the aromatic ring is optionally substituted with an alkoxy group or a methylenedioxy group, to the first region;

repeating steps (a) and (b) on other regions of the support whereby each of said other regions has bound thereto a molecule represented by the a formula of step
 (b) M<sub>1</sub>-Y<sub>1</sub>, wherein M [[M<sub>1</sub>]] is the same as or different from M [[M<sub>1</sub>]] of step (b) and Y<sub>1</sub> is the same as or different from Y<sub>1</sub> of step (b);

(d) <u>cleaving the bond between M and C=O in the monomeric building block</u>

removing Y<sub>t</sub> from the M<sub>t</sub> that is bound to one or more regions of the support to

provide one or more regions having an unmasked reactive site;

- (e) binding an additional molecule represented by the <u>a</u> formula <u>of step (b)</u> M<sub>1</sub>-Y<sub>1</sub> to the said one or more unmasked reactive sites, wherein <u>M</u> [[M<sub>1</sub>]] is the same as or different from <u>M</u> [[M<sub>1</sub>]] of steps (b) and (c) and Y<sub>1</sub> is the same as or different from Y<sub>1</sub> of steps (b) and (e); and
- (f) repeating steps (d) and (e) on regions of the support until a desired plurality of compounds is formed from the component molecules represented by <u>a</u> formula <u>of step (b)</u> M<sub>t</sub>-Y<sub>t</sub>, each compound occupying separate predefined regions of the support;

#### wherein:

 $\underline{M}$  [[ $M_1$ ]] is a monomeric building block selected from the group consisting of nucleic acids, nucleosides and analogs thereof, nucleotides and analogs thereof, and monosaccharides, all having a reactive site <u>attached to the carbonyl group indicated in the formula</u>; that is masked by  $Y_t$ ; and

Y<sub>t</sub> is a photolabile protecting group selected from the group consisting of:

## wherein:

the aromatic ring is optionally substituted with an alkoxy group or a methylenedioxy group;

A is O, S, N-alkyl, N-aryl or  $(CH_2)_n$ ;

n is 1 to about 3;

B is an aprotic, weakly basic group; and

R and  $R_1$  are each, independently, -H, an optionally substituted alkyl group, an optionally substituted alkenyl group, an optionally substituted alknyl group, an optionally substituted aryl group, or an optionally substituted heteroaromatic group,

and wherein the bond between M and C=O is capable of being cleaved by photolysis using light having a wavelength of about 365 nm.
